

Xiran Xing

[p5.js Web Editor](#) | [Clever chatter](#)

Generative Creature's name:	Digital Mousetrap
Scientific Name:	Muscipula Digitalis
Habitat:	Cyberspace
Discovered by/at:	The first computer in the world.
Appearance:	A flower-like creature with green surroundings.
Family:	Flytraps in the jungle.
Key Characteristics:	It interacts with the player as the mouse clicks and approaches, showing different appearance and movements. It tempts the user to come closer, swallow the mouse as food, and reproduce more.
What we know so far about this creature: (max 50 words) It maintains a calm appearance without interaction. But any approach and clicks from the mouse will lead to a sudden change of the mousetrap. There's some possibility that the reproduction would fail.	
How can we interact with this creature: (max 50 words) Approach its center, then it'll change its appearance. Click the mouse, then it'll start changing color. Maintain in its core for sometime, then the mousetrap will start reproducing in the surrounding locations.	

Renata Dai

<https://editor.p5js.org/MoonRdy/full/CUySi8KPg>

Generative Creature's name:	
Scientific Name:	Taraxacum Seed
Habitat:	Open digital voids with colorful and dynamic petals
Discovered by/at:	A sculpture depicting flowers with hard and sharp metal materials
Appearance:	A tiny glowing orb at its center, surrounded by three rings of outward-reaching filaments tipped with diamond-shaped ends — like a dandelion seed caught mid-flight
Family:	digital wind-dispersed organisms
Key Characteristics:	Drifts in gentle looping orbits when undisturbed. Its core pulses softly like breathing. Three layers of arrows rotate at different speeds, each responding to invisible currents. Highly sensitive to nearby presences.
What we know so far about this creature: (max 50 words) It wanders freely across the void in smooth, elliptical paths, guided only by internal rhythm. No fixed destination. It seems content in solitude, its filaments slowly spinning as if reading the air around it.	
How can we interact with this creature: (max 50 words) Moving close triggers its self-defense response — it contracts and pulls its filaments inward, making itself smaller to reduce exposure. Once the threat withdraws, it slowly restores itself to full form and resumes drifting.	

Joella Lin

<https://editor.p5js.org/xSprout/sketches/uGcxLQsRI>

Generative Creature's name:	Techno-Bee
Scientific Name:	Techno-apis
Habitat:	Sunny, grassy, and flower-dense areas; warm climate; gardens & meadows, particularly near cities.
Discovered by/at:	A scientist who experimented on injured bees.
Appearance:	Appears like a regular bee but with a different coloured coating, an indicator of the bee's energy level
Family:	Bees, Apoidea
Key Characteristics:	Flying movement; desire to pollinate flowers and gravitates towards them naturally; need to charge (electricity); close mimicry of real bees with deviations such as leaving a trail of small fumes
What we know so far about this creature: (max 50 words) A subspecies of bee which run on technological advancements. Although not subjected to the life span of a regular bee, it requires regular upkeep (charging) and leaves behind a trail of small fumes. Wanders around collecting pollen, but it will require charging after two rounds of pollination.	
How can we interact with this creature: (max 50 words) Using your mouse, hold a flower near techno-bees. They will naturally gravitate towards you unless they have recently pollinated a flower or are low on battery. It will follow the flower endlessly until it has landed on the flower for long enough to pollinate it.	

Diovanna Negeski

<https://editor.p5js.org/Negeski02/full/jva5OHDXe>

Generative Creature's name:	Lines of Life
Scientific Name:	Lineastasis Zoetamine
Habitat:	The cat's cradle where all things are connected
Discovered by/at:	The creator of all human connection
Appearance:	The creature is made of shapes in most of the time only circles, rectangles and lines, that respectively represents a nucleus, arms and legs and antennae
Family:	Unique
Key Characteristics:	The main characteristics of my creature is that its made from the the mutation of a imaginary cat's cradle, so as far as the cat's cradle is being moved the creature is also mutating, aiming to represent that from new interactions of the cradle the creature is fully being created, but suddenly something happens, and the creature is fully impacted by it: a disintegration.
What we know so far about this creature: (max 50 words) We know that "Lines of Life:" is a finding that show how exists a bigger Creator that controls all ways of living in its cat's cradle, and each line of it, is a way of "Lines of Life" existence, even though when the creature is broken in pieces with a disintegration allowed by the cat's cradle Creator, its strong nucleus make all the rest of the pieces come back together to life	
How can we interact with this creature: (max 50 words) The creature is already moving as the elastics on the cradle moves, so as any involuntary moves on the cradle, the creature keeps moving independently, if you HOLD and DRAG the creature will move around the canvas, if you MOVE IT far apart the center the creature will disintegrate, as you CLICK on the center the creature will also change, also the elastics are going to move	

Naransuud Turtogtokh

https://editor.p5js.org/Ansuug6/full/2mIQa_Odr

Generative Creature's name:	Ansv immunoid
Scientific Name:	Immunis horanghaei
Habitat:	Inside the human blood cells
Discovered by/at:	Biomedical lab that was studying mutation cells.
Appearance:	Alien-like organisms. It's usually very small but appears larger under the microscope. The creature's purple antenna senses viruses, therefore when viruses appear it disappears.
Family:	Horanghaei
Key Characteristics:	The viruses are afraid to come closer to the immune cell. It identifies and actively destroys viruses before any symptoms appear.
What we know so far about this creature: (max 50 words) It identifies viruses faster than normal immune cells.	
How can we interact with this creature: (max 50 words) It's mostly in patrol mode but when it's alerted(mouse is pressed) it's eyes enlarge and the movement becomes glitchy. The background also flickers with random colors as it fights with the virus cells.	

Jiaying Liu

<https://editor.p5js.org/jl17966-design/full/6TguehZ6g>

Generative Creature's name:	Meow-Rain
Scientific Name:	Felis Pluvia Interpolatus
Habitat:	Born: Rainy nights in mountainous areas. Live: In the sky
Discovered by/at:	Jiaying Liu, a rainy night in Jade Dragon Snow Mountain, Yunnan
Appearance:	A raindrop-like creature. Its head features two observant black eyes that track movement with precision. It typically glows with a white hue, while approaching, with a calm, cyan-blue hue.
Family:	<i>Interpolated Aquatic Feline</i> (A branch of the Generative Raindrop family characterized by high agility and mood-based color shifts).
Key Characteristics:	Can detect people's approaching Sensitive gaze following Change in speed and color when touched Can blend into the environment
What we know so far about this creature: (max 50 words) Meow-Rain is a traitorous entity that balances curiosity with a fierce need for personal space. It uses complex math to maintain a specific distance from others.	
How can we interact with this creature: (max 50 words) Approach its "territory" to watch it glide away. Click to startle it into a random color; it will eventually calm back to blue. Hold the mouse button while close to witness its "cloaking" defense, where it accelerates and fades into the dark background.	

Harper Zou

<https://editor.p5js.org/Harp3r-81/full/9nsCqTvCL>

Generative Creature's name:	Space Moth
Scientific Name:	Tinea Cosmica
Habitat:	Icy dwarf planets
Discovered by/at:	Hubble telescope when it was flying across Pluto
Appearance:	Transparent/White/???
Family:	Nobody knows. They're from another world, after all! For this specific space moth you're looking at, her <i>family</i> contains her mom, her dad and her pet.
Key Characteristics:	Poor sight, sensitive to sounds. They're easily irritated when they hear something. (please ignore why there's sound in space)
What we know so far about this creature: (max 50 words) This creature is really approachable!!! — unless you approach it wrongly. Please remember to say hi to it before rudely interrupting its life! When it favors you, it will no longer stay white, instead, it will appear in bright pink to show it likes you!	
How can we interact with this creature: (max 50 words) 1. Press the mouse to irritate it 2. Move the mouse to see how its whiskers move with it. 3. Press the "h" on the keyboard to say hi to it 4. It is more visible when you stay close to it so move the mouse closer to it	

El Ouadi Yasmine

https://editor.p5js.org/Ye__7/full/zP-1l2OQb

Generative Creature's name:	Parasite
Scientific Name:	Monozygotic Ascaris
Habitat:	Inside other larger living organisms.
Discovered by/at:	Discovered while detecting symptoms of disease and weakening inside other organisms.
Appearance:	Worm-like appearance, color ranging from red to orange-pink, pulsating eyes, unpredictable movement.
Family:	Inside the broad family of Ascaris.
Key Characteristics:	-Unpredictable and random frantic movements -Eyes are directed towards the general direction it is moving towards -Body pulsates and wiggles to move
What we know so far about this creature: (max 50 words) So far, we know this creature has rapid, unpredictable movements as it wants to consume more organisms as fast as possible to ensure its own survival.	
How can we interact with this creature: (max 50 words) We can interact with this creature by clicking anywhere on the screen, which will lead it to follow the position of the mouse: we are essentially showing it where to look for food to consume. Once left alone, it'll continue doing what it does best; wandering in search of more nutrients.	

Li HuiYan

<https://editor.p5js.org/Ashley-Li-Huiyan/full/djRgmPUSY>

Generative Creature's name:	Jellyfish
Scientific Name:	Aurelia aurita
Habitat:	Open sea with corals
Discovered by/at:	Together with fish in the net when caught by fishers.
Appearance:	Nearly transparent so you can only see the inner structures of its brain, wings and legs, but not the skin itself. It consists of simple lines and circles.
Family:	One of the broad species of Medusozoa
Key Characteristics:	It moves in a generally circular way with regular expansion and contracting. Its wings rotate with the same rhythm of its colors, each leg exhibiting different frequencies of movement.
What we know so far about this creature: (max 50 words) It follows the rhythm of sea waves and stays in corals. When a human approaches at a certain distance, it gets nervous and shrinks more the nearer he is. When it is disrupted by the surroundings, it also shrinks constantly. You might be attacked if it is irritated.	
How can we interact with this creature: (max 50 words) When the mouse is 200 pixels away or nearer, it shrinks the nearer the mouse gets. If you press the mouse, it shrinks cumulatively to a certain extent.	

Augustus Mahler

<https://editor.p5js.org/amm10329/sketches/WHRvLhFBY>

Generative Creature's name:	Pest
Scientific Name:	<i>optotermes formosanus</i>
Habitat:	Grassy Area
Discovered by/at:	Found destroying wildlife
Appearance:	Small, Spiky creature
Family:	Termites
Key Characteristics:	The creature hides in the shadows, only revealing itself when tempted with food. The creature enjoys eating whatever is given to it, so if you place the food where your flashlight is shining, the creature will reveal itself.
What we know so far about this creature: We know that the Pest enjoys hiding in the shadows, and feeds on whatever is near it. It has a seemingly everlasting hunger, and will do whatever it takes to eat when hungry. The Pest is also very quick. When you try to stomp on it, or capture it, it quickly avoids you.	
How can we interact with this creature: We can interact with the creature by moving the mouse around, acting as a flashlight, to reveal it. Another method is to click, which resembles you placing food on the ground. Once you click the first time, the creature goes to the mouse, and acts erratically. You can try and click on the pest again to capture it, but it will evade you and go back into hiding into the shadows.	

Evan Xiao

<https://editor.p5js.org/bx2181/full/OQgUX8hDZ>

Generative Creature's name:	SPARK
Scientific Name:	Spark-like organisms
Habitat:	Lighting Storm
Discovered by/at:	a storm with thunder and lightning
Appearance:	Unstable lightning sparks
Family:	Unknown
Key Characteristics:	• Nervous Movement: It constantly jitters and shakes like a loose wire connection. • Autonomous Drifting: When left alone, it navigates its environment smoothly using Perlin noise. • Magnetic Tethering: It gets highly attracted to foreign objects like a cursor if they enter its central territory. • Boundary Avoidance: If pulled too close to the edge of its environment, it will break the connection and escape back into autonomous drifting. • Breathing Edges: Its body is not solid. It is made of jagged, electric lines that expand and contract rhythmically over time.
What we know so far about this creature: Spark is a nervous, electricity-based lifeform living in a digital thunderstorm. It drifts aimlessly until a foreign object enters its central territory. It gets magnetically attracted to the cursor, but if pushed too close to the environment's edge, it breaks the connection and escapes into the storm.	
How can we interact with this creature: You interact with Spark using your mouse. When your cursor enters the central safe zone, Spark gets magnetically attracted and follows it while jittering nervously. If you drag it too close to the screen edge, the connection snaps and it escapes to drift autonomously in the storm.	

Nathan Chi

<https://editor.p5js.org/nathanchi15/full/ElHb7AyLL>

Generative Creature's name:	Dreamcatcher
Scientific Name:	Somnium captor digitalis
Habitat:	Appears in dark, quiet digital environment
Discovered by/at:	Subtly disrupting existing structures
Appearance:	A soft, layered, circular form made of repeating curved lines that pulse outward from a central point
Family:	Dream Forms
Key Characteristics:	Layered, concentric structure formed through repetition Smooth, organic motion that suggests breathing or growth Gradual transformation rather than sudden change Responsive to time and subtle interaction Maintains a stable center while the outer form evolves
What we know so far about this creature: (max 50 words) Dreamcatcher is a generative organism that slowly forms through repetition and motion. Its layered body appears to grow outward from a stable core, creating a calm but uncanny presence that feels alive despite being entirely digital	
How can we interact with this creature: (max 50 words) Interaction is observational and subtle. By watching over time or lightly engaging through user input, viewers influence its rhythm and form, encouraging a meditative experience rather than direct control or manipulation	

Brenna James

<https://editor.p5js.org/bmj5934/full/V4dZOD-yD>

Generative Creature's name:	Rainbow Snake
Scientific Name:	Camouflage to aim the predators
Habitat:	Changing colors while trying to take aim in catching the mouse
Discovered by/at:	Discovered by clicking the snake and expands it's body to catch the mouse
Appearance:	A pastel color with a river shaped form moving at the bottom, with the snake slithering through the blue background.
Family:	Unknown ?
Key Characteristics:	The snake becomes longer The movement becomes more intense Gradually changing the snake body's color The animal mouse moving away from the snake at a stable distance until the snake body expands.
What we know so far about this creature: (max 50 words) This creature is a responsive, snake-like being that follows the user's movement. It grows longer and moves more dynamically when pressed, suggesting emotional reactivity. Its flowing body and shifting color imply it is alive and adaptive, while its presence near water hints at a semi-aquatic nature.	
How can we interact with this creature: (max 50 words) We can interact with this creature through our mouse movements and clicks. It closely follows the cursor, suggesting it is aware of nearby motion. When we press the mouse, the creature grows longer and moves with more intensity, showing a responsive change in behavior. This implies it reacts to touch-like input, allowing us to influence its activity level and physical form through direct interaction.	

Munkhbileg Ganbold

<https://editor.p5js.org/Munhbilg/full/vbh8gTrwK>

Generative Creature's name:	Panic cell
Scientific Name:	Lacrymaria Anxietas
Habitat:	Unstable neural environments
Discovered by/at:	Discovered accidentally while experimenting on overstimulated brain cell at NYU Shanghai, 1:20pm
Appearance:	A semi-translucent orb with unstable shape that reacts under pressure
Family:	Psathyrellaceae
Key Characteristics:	Unstable, random movement Changes color depending on stress level Rapid pulsation when stressed Stabilizes when guided
What we know so far about this creature: (max 50 words) As time passes, it becomes more unstable. The color shifts from green to red, and its movement grows increasingly aggressive. The surrounding space appears aware of its location, forming reactive patterns	
How can we interact with this creature: (max 50 words) It can be guided through direct interaction. When clicked, it follows around the mouse and starts to calm down, When let go, it resumes its unstable reaction.	

Yimin Chen

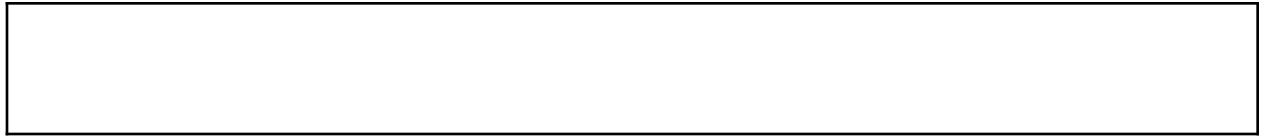

Link to your p5 sketch

Generative Creature's name:	Hungry Sacabambaspis
Scientific Name:	The Sacabambaspis
Habitat:	Deep under the sea. (Its habitat was primarily in shallow, coastal waters along the margins of the southern supercontinent Gondwana.)
Discovered by/at:	On the sea floor in 2026
Appearance:	Two round eyes, a triangle shaped mouth as if it's gasping all the time. Blush face. A disproportionately large, flat, and armored head, with a round body and tail.
Family:	Sacabambaspididae (primarily composed of other Sacabambaspis who look equally surprised).
Key Characteristics:	They like to eat and they swim very slowly. They appear wherever there's food and they try their best to wiggle their plump bodies to swim to the food.
What we know so far about this creature: (max 50 words) They aggregate in groups and demonstrate intense food-oriented behavior. Their emergence correlates strongly with snack presence. Individuals occasionally float ventral side upward (it depends on their mood.)	
How can we interact with this creature: (max 50 words) Put food in the water and they will appear. Watch them slowly wiggle toward it with great determination. They really want the food — they're just not very good at swimming fast.	

Anyuan (Andrew) Li

Link to your p5 sketch: <https://editor.p5js.org/AnDrewLi0174/sketches/oGfzYoSDy>

Generative Creature's name:	Northern Lights Spider
Scientific Name:	Aranea Borealis
Habitat:	The Atlantic Ocean, presumably near the ruins of Atlantis
Discovered by/at:	In 1988, records have shown sailor sightings of "ghostly, mesmerizing lights" in the middle of the night
Appearance:	A pulsing blob of light in the dark that hunts for food
Family:	The arachnea family, though precise correlation is unknown
Key Characteristics:	An agile hunter but at the same time timid in the face of larger creatures, the aranea borealis has biological lights that it uses to attract prey. Possessing a clear vision of the surroundings, it excels in hunting for food and also fleeing from danger
What we know so far about this creature: (max 50 words) It is a rare sight that they appear, only when conditions are ideal, but when they do. They look too clever for other members of the arachnea family, some suspect they belong to some other civilization.	
How can we interact with this creature: (max 50 words) You are a hermit crab moving your way along the murky water. Move the mouse off the screen to observe random drifting of the aranea. If the mouse is within the canvas, the aranea will start to chase you, if it gets too close, press the mouse to hide in the shell, this will repel the aranea.	

Tim Liu

Link: <https://editor.p5js.org/Tim031one/sketches/G7OTVVi0v>

Generative Creature's name:	Drifter
Scientific Name:	Oscillaria Noctis
Habitat:	Deep ocean currents in dark, low-light environments. It exists in slow-moving, fluid spaces where motion is subtle and continuous.
Discovered by/at:	Discovered during an experimental generative simulation exploring underwater motion patterns.
Appearance:	A soft, oval-shaped body with a glowing inner core. It gently expands and contracts like breathing. Its surface appears smooth and fluid, with subtle transparency and cool blue tones.
Family:	Oscillating Deep-Sea Organisms
Key Characteristics:	Slow drifting motion Rhythmic pulsing body Shrinks briefly when disturbed Movement defines its presence
What we know so far about this creature: (max 50 words) Drifter moves in a smooth, looping path, as if carried by underwater currents. Its body pulses steadily, suggesting a breathing rhythm. When sudden movement occurs nearby, it quickly shrinks inward before slowly returning to its original size. Its identity is shaped by motion rather than structure.	
How can we interact with this creature: (max 50 words) We can interact by moving the mouse near it. Slow movement allows it to drift peacefully. Fast movement disturbs it, causing the creature to shrink defensively for a brief moment. It responds to motion rather than touch, reacting to changes in its environment.	

Alex Stephens

Link: <https://editor.p5js.org/afs9024/sketches/A9jiyVE7P>

Generative Creature's name:	Space Octopus
Scientific Name:	Octonucleum astralis
Habitat:	Space
Discovered by/at:	SpaceX recently
Appearance:	The octonucleum astralis, commonly known as the space octopus, appears less like a biological organism and more like a living star suspended in motion. At its center floats a radiant, pulsating nucleus that resembles a glowing orb of concentrated energy. The core shifts in color subtly, cycling through deep violets, electric blues, and bursts of solar gold, as if powered by internal fusion. It doesn't have a solid surface; instead, its edges shimmer and blur, like heat rising from pavement or plasma folding in on itself. The nucleus expands and contracts in slow rhythmic pulses, suggesting both breath and gravity. Extending from the core are eight semi-transparent tendrils made of light rather than flesh. These limbs taper into fine filaments, flickering and fracturing into particles at their tips. They drift weightlessly, responding to unseen cosmic currents. When the creature moves, the tendrils trail behind in glowing arcs, leaving faint afterimages — like long-exposure astrophotography. Occasionally, sparks ripple down each arm, as if signals or electrical impulses are traveling through them.
Family:	Astralopodidae

Key Characteristics:	The space octopus is a plasma-based, bioluminescent organism centered around a radiant energy nucleus that functions as both its brain and power source. Its body lacks solid mass and is instead composed of stabilized light and electromagnetic fields, giving it a shimmering, fluid appearance. Eight photonic tendrils extend from the pulsating core, drifting weightlessly and leaving faint luminous trails as it moves through space. The creature subtly shifts color depending on its internal energy state, transitioning between deep blues, violets, and flashes of gold. Surrounded by a faint gravitational distortion halo, it can draw in small particles of cosmic dust that orbit its core. Intelligent yet silent, it communicates through electromagnetic pulses and harmonic light frequencies, existing as a conscious entity formed not from matter, but from energy itself.
What we know so far about this creature: (max 50 words) The space octopus is a sentient, plasma-based organism powered by a radiant energy nucleus. It moves using electromagnetic pulses, shifts color with internal states, and regenerates its light-formed tendrils. Surrounded by a faint gravitational field, it absorbs cosmic radiation for sustenance and communicates through harmonic light frequencies.	
How can we interact with this creature: (max 50 words) You can interact with the creature by gently holding it with the mouse, guiding its nucleus through space. When held, its tendrils tighten and glow brighter. Release it, and it drifts freely again, leaving soft light trails as it responds to your movement.	

Student Name

Link to your p5 sketch

Generative Creature's name:	
Scientific Name:	
Habitat:	
Discovered by/at:	
Appearance:	
Family:	
Key Characteristics:	
What we know so far about this creature: (max 50 words)	
How can we interact with this creature: (max 50 words)
